

Empathy Map

Date	14 July 2026
Team ID	SWTID-2026-7049
Project Name	Emotion Detection & Learning Support Engine (AI Learning Assistant)
Maximum Marks	4 Marks

Empathy Map

This empathy map captures the target user — a student engaged in self-paced or independent study — from four perspectives, in relation to the problem the project addresses: recognizing and responding to the emotional state behind a study difficulty, rather than only its surface content.

SAYS • "I don't get why this doesn't work the way it did in the last example." • "I already know this — can we move faster?" • "I've read this page three times and none of it is sticking." • "Wait, what happens if I try it this other way instead?"	THINKS • Is it just me, or is this actually badly explained? • Maybe I'm not cut out for this subject. • I wonder if there's a shortcut nobody's shown me. • I could really use someone to just tell me if I'm on the right track.
PERSONA The Self-Paced Learner <i>(Student studying independently, outside a live classroom setting)</i>	PERSONA The Self-Paced Learner <i>(Student studying independently, outside a live classroom setting)</i>
DOES • Rereads the same paragraph or rewatches the same video segment repeatedly • Skips ahead or multitasks when the material feels repetitive • Searches for outside explanations mid-session instead of finishing the current one • Keeps attempting the same approach without changing strategy when stuck	FEELS • Frustrated when repeated attempts don't work • Confused when new material has no clear entry point • Confident, but unacknowledged, after getting something right • Bored when material doesn't adapt to how they're engaging with it • Curious, but without an obvious next step to take it further
