

Customer Journey Map

Date	14 July 2026
Team ID	SWTID-2026-7049
Project Name	Emotion Detection & Learning Support Engine (AI Learning Assistant)
Maximum Marks	2 Marks

Customer Journey Map

Maps the student's experience through the AI Learning Assistant stage-by-stage, from describing a study problem through to reflecting on accumulated emotional trends, with the actual module responsible for each stage and honestly-scoped opportunities for improvement.

Phase of Journey	Stage 1: Describe the Problem	Stage 2: Get Analyzed & Guided	Stage 3: Reflect via Analytics
Actions (What does the student do?)	- Reads the welcome splash - Selects a field of study - Types a description of the problem - Adjusts settings (AI on/off, save data, show details)	- Clicks "Analyze" - Waits through the loading spinner - Reads the Decision Summary and AI Guidance - Optionally opens Model Comparison / How I Decided	- Runs several problems across a session - Opens the Learning Analytics tabs - Reviews emotion distribution, timeline, and per-field breakdown
Touchpoint (What part of the app do they interact with?)	- Sidebar + main input form - field_problem_capture.py - ai_toggle / save_data_toggle / show_details_toggle	- Analyze button - analysis_pipeline.run_analysis() - result_panel.py (decision summary, AI guidance, model comparison, how-I-decided)	- analytics_dashboard.py (Emotions / Fields / Summary tabs) - session_history.py - csv_logger.py
Customer Thought (What is the student thinking?)	"Will this actually understand what I'm struggling with, not just keyword-match it?"	"Okay, it picked up on how I'm actually feeling. Does its explanation for that match what I said?"	"Am I getting stuck the same way across different subjects, or is this just one topic?"
Customer Feeling (What is the student feeling?)	- Cautious curiosity - Mild skepticism about whether it will "get it"	- Felt understood and reassured when trust is HIGH - Mildly uncertain when trust is MEDIUM/LOW and the reason is shown	- Engaged - Motivated to keep using the tool for self-reflection
Process Ownership (Who is in the lead on this?)	UI / session-state layer — Epic 5 (layout, toggles)	Inference + orchestration layer — Epics 2-4 (BiLSTM/BERT predictors, decision engine, LLM clients)	Persistence + analytics layer — Epic 3 T6 and Epic 5 T4 (CSV logging, session history, Plotly charts)
Opportunities (How can we improve this stage?)	CSV-based retrieval prediction toggle exists but is disabled — could speed up input for repeat scenarios if built out	Bring-your-own API key was dropped this submission (LLM clients are module-level singletons) — would remove the shared free-tier bottleneck if revisited	- Summary tab is intentionally empty, held as a clean slot for a later dashboard-metrics pass - Fields tab doesn't yet facet by which model drove the decision
